SUMMARY

Engineer-turned-designer, 12+ years shipping enterprise SaaS and AI-assisted product surfaces across banking, supply chain, oil & gas, e-commerce, and cloud database tooling. I design the seam between humans and AI agents — the moment of decision, override, and trust — and ship working code prototypes of those interaction patterns, not just Figma. Currently focused on agentic workflows, calibrated-confidence UX, and design systems that scale across enterprise products.

SELECTED WORK — AGENTIC & HUMAN-AI INTERACTION

A connected trilogy of production-quality code prototypes (React 19 / TypeScript / Tailwind v4) on one thesis: **AI claims become trustworthy only when their uncertainty is legible and their basis is checkable**. Each ships with a live demo and a shared design vocabulary (calibrated confidence, cross-hatch failure-mode pattern, evidence anchors, per-decision audit object).

Helm — Real-time oversight of LLM agents

github.com/sinhaankur/Helm · [Live demo](#)

Puts the human back in the loop *while* the agent acts: every tool call is previewed with intent, target, diff, and cost. Designed six primitives (ToolBadge, ReversibilityChip, ConfidenceTag, DiffView, ApprovalGate, AgentStream) around a single idea — **reversibility (recovery cost), not "safety," is the policy axis**: auto-allow caps at reversible; irreversible steps always pause.

Sentinel — Embeddable inline oversight layer for AI tools

github.com/sinhaankur/Human-in-the-Loop · [Live demo](#)

A drop-in oversight layer any AI tool can adopt, shipped **four ways** (React library, Chrome extension over real ChatGPT, VS Code Copilot wrapper, Docker demo). Designed the calibrated-confidence vocabulary (Likely / Unsure / Low → exact % on hover), a distinct hallucination chip, and a verdict rail that blocks rubber-stamping the moment any claim is edited.

Recourse — Consumer AI as advocate against institutional loops

github.com/sinhaankur/Recourse · [Live demo](#)

A document-first workflow (not a chatbot) that helps people contest insurance denials with statute-anchored claims and a cadence engine that never lets a deadline slip. Confidence language flipped to action verbs (Settled / You verify / Ask a lawyer); every claim anchored to a real statute with excerpt and plain-language gloss. Outcome-driven design — the win condition is being *unexhaustible* against an adversarial process.

SELECTED WORK — ENTERPRISE SAAS & WORKFLOW PRODUCTS

BuildingSync — Multi-tenant property management SaaS

github.com/BuildingAi-Cloud

Founder, designer, and full-stack engineer of a three-platform product (Next.js web/admin, SwiftUI iOS, Kotlin/Compose Android) on a shared Supabase backend. Designed for **11 personas** and **5 building-type variants** that drive divergent payment, lease, and feature surfaces; architected an OpenAPI-contract layer so all three apps stay in sync as the product grows.

GovLens — Context-aware overlay for government portals

github.com/sinhaankur/GovLens

Chrome extension for 25+ national gov TLDs: translation (100+ languages), structural navigation, a 0–100 usability score across 8 axes, and a region-aware jargon explainer. Designed a **three-engine translation cascade** (on-device AI → Google Translate → Anthropic Claude, BYOK) with the panel showing *which engine will answer before you click*.

WatchTower — Self-hosted deployment platform for developers

github.com/sinhaankur/WatchTower (Python · Electron · 4★)

Operator tooling for container auto-updates, multi-node deployment, and guided host ops. Ships across macOS/Windows/Linux, Snap, PyPI, and VS Code. Designed the integrations dashboard for six interconnected tools (Podman / Nginx / Tailscale / Cloudflare / Coolify / Watchdog) so one operator sees live status and can recover any of them.

EMPATHEIA — Multi-modal AI companion (offline-first)

github.com/sinhaankur/ideal-giggle

Next.js + AI SDK PWA with camera-based expression detection feeding mood-aware tone. Designed a **hybrid-intelligence fallback**: if the model runtime fails, empathy-map quadrants still update via deterministic heuristics — the user never hits a dead surface. Local (Ollama) or cloud provider paths.

EXPERIENCE

Principal UX Designer — Oracle, Cloud Database Tooling & AI Orchestration · Feb 2020 – Present

Lead designer on Oracle's Database-as-a-Service (DBaaS) and database-tooling surfaces in OCI. I design at the design–engineering seam: I own flows end-to-end and prototype them in code, not just Figma.

- Designed the console flows for **Transparent Data Encryption (TDE) with OCI Vault/KMS** — provisioning, host-wallet→KMS migration, and key rotation across VM and bare-metal database services.
- Designed **PDB (pluggable database) lifecycle management** for DBCS/ExaCS/ExaCC, bringing previously host-only, manual operations into the OCI Console, SDK, and Terraform.
- Designed **Cross-Region Autonomous Data Guard** — standby creation, buddy-region selection, and automatic/manual failover, so applications reconnect seamlessly to the new primary.
- Shipped supporting surfaces: Refreshable Clone (scheduled/continuous refresh), Autonomous Data Guard maintenance & patching, ADB time-zone updates, and Spatial Studio (DB Tools).

UX Designer / Product Strategist — Deloitte Touche Tohmatsu India · Apr 2018 – Feb 2020

Brought UCD process to enterprise channels (Salesforce, Supply Chain ERPs). Conducted E2E user-requirement analysis; iterated information architecture and reporting surfaces with stakeholders across product, engineering, QA, and clients.

Lead UX Designer — Snowtint Technologies · Sep 2016 – Mar 2018

Founded and led the company's first UX team. Built a group of interaction designers and researchers; owned production and delivery across web, social, and mobile properties; set strategic UX direction.

UX Designer (Jr → mid) — Rage Communication · Jun 2015 – Jul 2016

Banking and consumer projects (Citibank NA / India / Philippines, HSBC, Deutsche Bank, Vodafone, Unilever, CEAT, Quikr). Wireframes, interaction design, end-user interviews, client presentation.

IT Analyst — IBM India · Jun 2013 – Jul 2014

HOW I WORK

- **I code my own prototypes** (React/TS, SwiftUI, Compose, Next.js) and hand off to engineering with the contract already in code — not just Figma.
 - **Design-systems thinking for AI surfaces:** calibrated language over raw percentages, reusable verdict / approval / audit shapes, one visual primitive for category-different failure modes.
 - **Reversibility, not "safety," is the policy axis** — recovery cost determines when a system must pause for the human.
 - **Outcome-driven over task-driven** — design for the result the user actually wants, then let them steer the system there.
-

EDUCATION & CERTIFICATION

- **B.Tech, Computer Science** — BTLIT Bangalore, VTU · 2008 – 2013
 - **HFI Certified Usability Analyst (CUA)**
-
